

Pr Franz Adlkofer, (01 10 2007-Germany).
Conference to University of Gelsenkirchen.

Stuttgart, 06.10. 2007

Professor Franz Adlkofer, Verum-Foundation :

No doubt: UMTS much more dangerous than GSM

Adlkofer found DNA string breaking at **1/40 of the limits**, that means **UMTS is ten times more effective than GSM and thus leads to a higher risk of cancer.**

He mentioned the INTERPHONE which shows an increase of brain tumors after 10 years of use, and Friedman, Israel, who found out the biological mechanism of cell damages by mobile phone radiation far below the limits.

Adlkofer called for an immediate **change in thinking**. He warned that there would emerge a huge health problem to our society which is using the technical EMF increasingly. He named the mobile phone technology and its political justification a **great experiment in humans without control and without plan**.

In the 6th of December 2006 the Committee for Radiation Protection still declared that no genotoxic effects were known. Adlkofer: **An absolutely unintelligible text.**

He appealed to the politicians that the precautional principle should be acknowledged for the protection of the citizens. This acknowledgement, not the denying of possible risks should be the basis of future risk communication.

Tabacco, asbestos and x-rays were examples of the fact that decades might pass before science was able to supply the last proof of a health risk.

Action in time might save a late (and troubling) lesson!
